

# Fuel System Controls and Communications

# Mission Critical Fuel Control Systems

## Total Fuel Management System

A completely pre-programmed, PLC-based system, our TFM Control Module gives the operator complete control over the mission critical fuel system. Our modular approach to fuel systems gives the operators and design engineers flexibility in the design and deployment of their systems. Our controls provide the security of fail-safe operation with a focus on communications.

## Custom Engineered Solutions

Sometimes, a standard system won't provide the necessary level of control for unique projects. You can work directly with our application experts to design a system that satisfies current codes and regulations while meeting operational requirements. Though these systems may be complex, our controls engineers will ensure the operation is effortless and the integration is easy.

## Integration and Communications

You may specify a wide range of communication protocols, allowing us to integrate seamlessly with most tank gauging and building management systems.
