

Day Tanks, Fill Manifolds, and Accessories for Mission Critical Applications

Day Tanks and Accessories

Critical Fuel Systems builds complete day tank systems with standard sizes from 60 to 600 gallons. This market has changed as more and more customers are demanding the security of complete containment provided by the totally-enclosed, double-wall design. Even though the double-wall tank is now our standard, we still offer the single-wall systems with or without rupture basins. More information can be found at www.criticalfuelsystems.com

Critical Fuel Systems also provides a complete line of day tank accessories, from level controls to fill manifolds, to meet your fuel equipment needs.

- Fill Manifolds
- Return Pumps
- Level Monitoring
- Level Control
- Venting
- Tank Trim

Double-Wall Day Tanks

The double-wall day tank is a superior design in most applications. Unlike open-top rupture basins, the outer wall of a UL-listed double-wall day tank is pressure tested in accordance with UL 142, providing complete containment upon failure of the primary vessel.

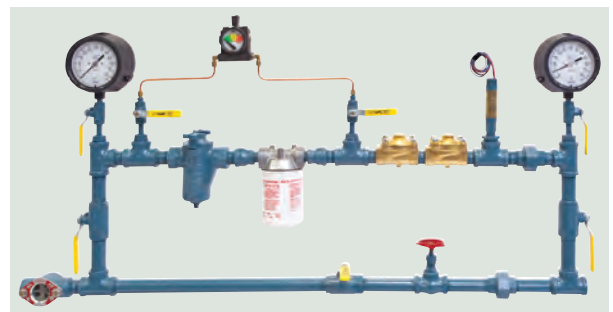

Single-Wall Day Tanks

A lower-cost solution for specific applications. We offer a complete line of accessories including rupture basins, fill manifolds, and level controls to help round out our offering.

Fill Manifolds and Accessories

Modern, sophisticated fuel systems demand complete and accurate control of these systems. Critical Fuel Systems provides all of the components to make a complete system.
